

USER GUIDE

Hook Video Generator

A local tool for turning one source video into a short hook compilation while preserving source quality, optionally matching cuts to music beats, and exporting a final hook video.

INPUT

One source video

OUTPUT

Rendered hook MP4

RUNS

**Locally on your
machine**

What This App Does

Hook Video Generator analyzes a source video, chooses high-energy highlight candidates, lets you edit those moments, and renders a short compilation. It can keep the original source aspect ratio or create a new output shape with auto reframe.

The app can also analyze a local music file, find a strong section, detect beats, build a Music Director plan, auto-select a beat style, and cut highlights to that rhythm.

Main workspace with input controls, previews, highlight rows, music controls, and export settings.

Recommended Workflow

1. Choose

Select the source video file.

2. Analyze

Generate hook highlight candidates.

3. Review

Adjust starts, durations, and previews.

4. Music

Optional: analyze music and enable beat cuts.

5. Render

Choose output settings and render the final hook.

Input And Analysis Controls

The Input section is where you select the source video and control how highlight candidates are found.

CONTROL	WHAT IT DOES	WHEN TO CHANGE IT
Source video path	Shows the source video used for analysis and rendering.	Change this whenever you want to work on a different video.
Choose	Opens the native file picker and uses the original file path.	Use this instead of typing paths by hand.
Clip seconds	Sets the default length of each selected hook segment.	Use 2-4 seconds for fast hooks, 5-8 seconds for slower pacing.
Max clips	Limits how many highlight candidates are created.	Increase it when you want more choices before rendering.
Scene threshold	Controls how sensitive scene-change detection is.	Lower values find more cuts; higher values find fewer cuts.
Analyze Hooks	Runs video analysis and builds the highlight list.	Click after choosing a source video or changing analysis settings.
Cancel	Stops the active analyze, music analyze, or render job.	Use it when a long video is taking too long.
Metrics	Shows resolution, FPS, number of highlights, and hook duration.	Use this to confirm the project is using the expected source settings.

Preview Area

The Source preview shows the selected original video. The Hook preview shows either the generated preview render or the final rendered output. Both previews have a Full button for fullscreen viewing.

The source preview is not the final hook. It is only there to confirm the input file and inspect source content. Click Preview Hook to check the full edit with effects and music before final rendering. Preview renders use a smaller 720px maximum edge so they finish faster than a full-resolution final render.

Highlight Editor

The highlight table is the editable compilation timeline. Each row is a clip pulled from the original source video.

Preview	127.3	3	Remove
Preview	152.266	3	Remove
Preview	163.979	3	Remove

Highlight rows include preview thumbnails, signal hints, start time, duration, and removal controls.

CONTROL	WHAT IT DOES
Preview	Shows a small frame from the clip so you can judge the moment quickly.
Signal hints	Shows the strongest analyzed signals for that highlight, such as energy, motion, scene change, dialogue, beat strength, or face focus.
Start	Seconds into the source video where this highlight begins.
Duration	How many seconds this highlight lasts in the final hook.
Add	Adds a manual highlight row.
Remove	Deletes that highlight from the compilation list.
Save	Saves your edited project settings and highlight list.
Preview Hook	Generates a faster managed preview file using the current highlights, effects, music, color boost, and export settings, then loads it into the Hook player.
Render Final Hook	Starts final rendering using the current highlight list and export settings.

Music Controls

Music is optional. If you add it, the app can analyze the music file, choose a strong section, detect beats, build a Music Director plan, and help cut highlights on rhythm.

Music controls manage the music source, analyzed section, volume, and beat-sync settings.

CONTROL	WHAT IT DOES
Music file	Selects a local audio file such as MP3, WAV, M4A, or AAC.
Music URL	Accepts a direct audio/video file URL. YouTube watch links are not direct files.
Analyze Music	Measures the music, finds a strong section, detects beats, suggests beat style, and builds the Music Director plan.
Full music file player	Lets you listen to the entire selected music file.
Analyzed section player	Lets you listen only to the chosen music segment.
Music start	Start time of the music segment used in the final render.
Music seconds	Length of the music segment used in the final render.
Music volume	Volume of the background music in the final hook.
Source volume	Volume of the original source-video audio in the final hook.
Use music in final render	Turns background music on or off for the render.
Use entire music file	Uses the whole selected music file instead of an analyzed segment.
Cut highlights to music beats	Uses the Music Director beat grid to switch between different highlight moments. Fast drum sections can rapidly jump from one analyzed highlight to another instead of slicing one clip in place. The selector also uses per-highlight motion, scene, dialogue, and audio-spike metadata to avoid visually similar back-to-back cuts when enough highlights are available.
Edit energy	Controls how intense the automatic beat edit feels. The app recommends this after music analysis. Calm merges more small cuts, Balanced follows strong rhythm changes, and Aggressive keeps more fills and drop hits.
Beat style	Controls how aggressively highlights follow the beat. The app auto-selects this after music analysis, but you can still adjust it.

Music Director

After music analysis, the Music Director summarizes the song tempo, energy curve, section flow, cut points, and effect hits. Sections such as intro, build, and drop help the renderer keep slow parts calmer and make faster parts more energetic. The beat-edit timeline shows sections, cut roles, and effect hits so you can understand the auto edit before previewing or rendering.

Beat Style Meaning

STYLE	BEST FOR	BEHAVIOR
Loose	Slower music or dialogue-heavy edits.	Longer cuts with fewer beat jumps.
Tight	General short-form hooks.	Balanced cut timing that follows the rhythm without becoming too frantic.
Fast	Dense beats, energetic edits, rapid hooks.	Shorter cuts and faster pacing.

Render And Export Settings

The Render section controls the final video shape, effects, output path, render engine, and cleanup behavior.

Export settings choose final aspect ratio, effects, render mode, and output location.

CONTROL	WHAT IT DOES
Final aspect	Chooses the output format. Source original keeps the source resolution and aspect ratio. Other options create vertical, square, portrait, or landscape exports.
Effects	Selects visual cut effects. Auto director chooses slower, punchier, or faster motion based on the Music Director plan, detected beat strength, and local tempo. The app recommends this field automatically after hook analysis and refines it after music analysis.
Color boost	Adds an HDR-style grade to normal SDR video. Natural is subtle; vivid is stronger. This is a visual boost, not true HDR metadata.
Auto reframe when aspect changes	When final aspect differs from the source, the app can reframe the source automatically so the important region stays visible. Hook analysis creates focus keyframes when it can detect a face; if no reliable subject is found, the app keeps a stable center frame instead of drifting around the video.
Output path	Where the final <code>hook.mp4</code> will be saved.
Render engine	Auto GPU lets the app use GPU acceleration when possible. Force GPU requests GPU rendering. CPU only avoids GPU rendering.
GL	Chooses the graphics backend for Remotion rendering. Use <code>angle</code> first; try <code>vulkan</code> , <code>egl</code> , or <code>swiftshader</code> if rendering fails.
Concurrency	How many render workers Remotion can use at once.
Timeout min	Maximum wait time for slow frame rendering before failing.
Clear workspace after render	Clears app-created workspace files after rendering. The final output video is kept.
Clear workspace	Clears current source/project/highlight workspace data that the app tracks in its manifest.

Effects

The Effects menu can still be changed manually. The recommendation below it is only a starting point based on analyzed video motion, dialogue/face signals, audio spikes, per-highlight variety, and music beat pacing.

EFFECT	WHAT IT DOES
Clean cuts	Simple clip stitching with fades and the progress bar.
Auto director	Uses the Music Director plan, beat strength, and local music pace to choose between slow motion, beat punch, impact, and kinetic whip moments.
Slow motion	Slows the source playback, softens contrast, and adds a calm vignette for slower songs or emotional moments.
Kinetic whip	Speeds the clip up, adds restrained motion blur, speed-line texture, and quick side movement for dense fast beats.
Slow-fast ramp	Follows songs that build from slow to fast, moving from slower playback into punchier and faster kinetic moments using the detected energy curve. If no music is analyzed, it still uses a gentle beginning-to-end ramp.
Beat punch	Adds a short impact pulse at cut points without changing speed.
Flash cuts	Adds a brighter flash on clip changes.
Impact shake	Slows the clip down and adds heavier shake/dark vignette on impact cuts when auto reframe is active.

Source original output keeps the source aspect ratio and avoids crop, stretch, or letterbox changes. Aspect conversion settings are only for when you intentionally want a new final shape.

Troubleshooting

ISSUE	WHAT TO TRY
Music analysis button is disabled	Choose a music file and analyze hooks first so the app knows the hook duration.
YouTube link does not analyze	Use a local music file or a direct audio/video file URL.
Render fails with graphics errors	Try CPU only or switch GL to <code>swiftshader</code> .
Render is slow	Use Auto GPU or Force GPU, lower concurrency if the machine is overloaded, or increase timeout.
Highlights feel too fast or too slow	Change Clip seconds, edit row durations, or adjust Beat style.
Final hook does not update	Click Save after editing highlights, then Render Final Hook again.
